Investment Strategy and Objective:

The Rockman Capital Balanced Portfolio serves to provide investors with a balance between capital preservation and long-term appreciation. The portfolio seeks to achieve this by combining exposure to various asset classes, specifically equities and fixed income. We actively manage the asset class exposure on an ongoing basis.

Portfolio Fundamentals:

A universe of investable counters and instruments is maintained on an ongoing basis. We follow a research-based approach. From this universe a consensus of forecasts is derived. A mean-based forecast return is calculated and continuously interrogated. Strategic asset allocations are made, seeking to anticipate market movements and reacting according to market dislocations. Broader investment themes are kept up to date, based on industry research and by our investment team anticipating developments in the global economy.

Client Portfolio Construction:

Segregated portfolios are structured within the predetermined mandate and according to clients' specific needs. The Rockman Capital investment team uses their combined expertise to construct portfolios that generate wealth through the discretionary management of unique equity portfolios. We apply a top-down macro analysis. This ensures that we get the big investment narratives right, by investing in the appropriate jurisdictions. Our bottom-up, means-based process ensures we select the investment counters that are expected to match your individual risk-adjusted returns. This allows your portfolio to be tailored to suit your individual investment needs. We constantly reassess and adapt your portfolio according to your changing personal circumstances or risk profile together with prevailing market conditions.
